

**IN THE CLAIMS:**

Please **CANCEL** claims 2, 6, 11, 12, and 17 without prejudice or disclaimer.

Please **AMEND** claims 1, 3, 7, 8, 10, 14, and 18 as follows.

1. (Currently Amended) A method, comprising:  
receiving beacon frames at beacon intervals;  
extracting beacon interval information from a beacon frame;  
monitoring data traffic of a terminal;  
defining at least one parameter describing a data traffic pattern of the terminal; and  
dynamically controlling a power state of the terminal by the terminal, on the basis  
of said at least one parameter describing the data traffic pattern of the terminal and the  
beacon interval information, so that the terminal is maintained in one of at least two  
power states; and  
supplying additional input data comprising at least one requirement parameter  
describing requirements set by an application, active in the terminal, for the controlling  
the power state of the terminal,  
wherein said at least two power states comprise an active state and a power save  
state, and  
wherein the monitoring comprises monitoring packet sizes and packet intervals of  
the data traffic.

2. (Cancelled)

3. (Currently Amended) A method according to claim 21, wherein said at least one parameter describes packet sizes and packet intervals.

4. (Previously Presented) A method according to claim 1, wherein the controlling comprises determining a sleep interval defining time periods when the power save state is possible.

5. (Previously Presented) A method according to claim 4, wherein the determining comprises determining parameters indicating a timing, a length, and a frequency of the sleep interval.

6. (Cancelled)

7. (Currently Amended) A method according to claim 61, wherein said at least one requirement parameter indicates the maximum period that the terminal may continuously be in the power save state.

8. (Currently Amended) A method according to claim 6<sup>1</sup>, wherein said at least one requirement parameter indicates the quality of service level required by the application.

9. (Previously Presented) A method according to claim 8, further comprising:  
mapping the quality of service level to input parameters for the controlling the power state of the terminal.

10. (Currently Amended) An apparatus, comprising:  
a receiver configured to receive beacon frames at beacon intervals;  
an extractor configured to extract beacon interval information from a beacon frame;  
a traffic monitor configured to monitor data traffic of a terminal and to define at least one parameter describing a data traffic pattern of the terminal; and  
a controller configured to manage power for dynamically controlling a power state of the terminal on the basis of said at least one parameter describing the data traffic pattern of the terminal and said beacon interval information to maintain the terminal in one of at least two power states,  
wherein said at least two power states comprise an active state and a power save state,

wherein the traffic monitor comprises a packet analyzer configured to analyze packet sizes and packet intervals,

wherein the controller comprises an interface configured to control applications residing in the terminal and to receive additional input data from an application, and

wherein the additional input data comprises at least one requirement parameter describing requirements set by the application for the controller.

11-12. (Cancelled)

13. (Previously Presented) An apparatus according to claim 10, wherein the terminal is a wireless local area network terminal.

14. (Currently Amended) A system, comprising:  
at least one system entity configured to broadcast beacon frames at beacon intervals; and

at least one wireless terminal configured to extract beacon interval information from a beacon frame,

wherein said at least one wireless terminal comprises

a traffic monitor configured to monitor data traffic of said at least one wireless terminal and to define at least one parameter describing a data traffic pattern of the terminal, and

a controller configured to dynamically control a power state of said at least one wireless terminal on the basis of said at least one parameter describing the data traffic pattern of the terminal and said beacon interval information to maintain said at least one wireless terminal in one of at least two power states, wherein said at least two power states comprise an active state and a power save state,

wherein the traffic monitor comprises a packet analyzer configured to analyze packet sizes and packet intervals,

wherein the controller comprises an interface configured to control applications residing in the terminal and to receive additional input data from an application, and

wherein the additional input data comprises at least one requirement parameter describing requirements set by the application for the controller.

15. (Previously Presented) A system according to claim 14, wherein said at least system entity is a wireless terminal.

16. (Previously Presented) A system according to claim 14, wherein said at least system entity is an access point connected to a wired network.

17. (Cancelled)

18. (Currently Amended) An apparatus, comprising:

receiving means for receiving beacon frames at beacon intervals;

extracting means for extracting beacon interval information from a beacon frame;

traffic monitoring means for monitoring data traffic of a terminal and to define at least one parameter describing a data traffic pattern of the terminal; and

controlling means for managing power for dynamically controlling a power state of the terminal by the terminal on the basis of said at least one parameter describing the data traffic pattern of the terminal and said beacon interval information to maintain the terminal in one of at least two power states,

wherein said at least two power states comprise an active state and a power save state,

wherein the traffic monitoring means is further for analyzing packet sizes and packet intervals,

wherein the controlling means is further for controlling applications residing in the terminal and receiving additional input data from an application, and

wherein the additional input data comprises at least one requirement parameter describing requirements set by the application for the controlling means.
